pronounced duration, or lag, after exposure of the PA to a suitable animal or human PG. The hybrid streptokinase-fibrin binding domain polypeptides are useful in thrombolytic therapy for various kinds of cardiovascular disorders. The hybrids have enhanced fibrin selectivity as well as kinetics of plasminogen activation that are distinct from that of natural streptokinase in being characterised by a temporary delay, or lag of several minutes in the natural rate of the catalytic conversion of plasminogen to plasmin (i.e. delayed-action thrombolysis). The proteins can bind tightly with fibrin in blood clots soon after introduction into the vascular system without significantly activating the circulating blood plasminogen to plasmin, thus adding in the localisation of the plasminogen activation process to the site of pathological thrombus. This overcomes systemic plasminogen activation encountered during clinical use Sequence 414 streptokinase. (Updated on 12-SEP-2003 to standardise OS field)

Claim 4; Col 11-14; 17pp;

The present invention describes a mutant streptokinase (SK) polypeptide in which at least one of the amino acids in the Pro88-Ly859-Ser60-Ly861 segment of the corresponding native SK is replaced by another amino acid The present sequence is mutant SK K59E. SK is a secretory protein of haemolytic Streptococcus able to activate human plasminogen (HPlg) to plasmin (HPlm), which is a serine protease able to catalyse the hydrolysis of fibrin in blood clots. The SK is useful as a thrombolytic agent in the treatment of vascular thromboembolytic symptoms such as acute myocardial infarction. Compared with wild-type SK, the K59E mutant is more resistant to degradation by human plasmin and is more effective both in acting as a fibrolytic agent and in activating human plasminogen

> producing pharmaceuticals, comprises selecting a recombinant nucleic comprising nucleic acid fragments encoding a leader peptide and the polypeptide. acid

Claim 4; Page 82-83; 109pp; English.

The invention relates to a novel method for harvesting a (poly)peptide produced by a recombinant host cell. The novel method involves selecting a cell comprising a first nucleic acid encoding a leader peptide and a second nucleic acid fragment encoding the desired (poly)peptide. The first and second fragments are within the same open reading frame of the first nucleic acid and the leader peptide is functionally equivalent to an N-terminal leader peptide found with the pre-peptide of a lantibiotic. The host cells and nucleic acids are useful for producing, harvesting and post-translational modification of polypeptides. The polypeptides may be used in the production of pharmaceuticals, e.g. as antigen for vaccine or immunogenic composition. This sequence represents a polypeptide relating to the novel method of the invention.

This fusion protein was used in the design of modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, optionally as a bolus rather than by continuous infusion. The gene was fused to DNA encoding the yeast alpha factor pre-pro-secretion sequence in an expression vector, pSMD1/152, for prodn. of recombinant strepto- kinase in S. cerevisiae strain BJ2168. This fragment was used in the design of a modified streptokinase has an in vitro degradation rate at least 2 times slower than that of native streptokinase. Compounds containing modified streptokinases are specifically used as thrombolytic agents for dissolving blood clots in vivo in a mammal, preferably at a dose of 20000 U/kg, opt. as a bolus rather than by continuous infusion. Reducing immunoc sequence of the given species. immunogenicity of proteins - by modifying the amino acid of the protein to eliminate potential epitopes for T-cells 0f B

6; Fig 28; 77pp; English.

The invention relates to a method for the production of non-immunogenic CC proteins. The method comprises determining at least part of the amino CC acid sequence of the protein; (b) identifying in the amino acid sequence on or more potential epitopes for T-cells (T-cell epitopes) of the given CC species; and (c) modifying the amino acid sequence to eliminate at least CC one of the T-cell epitopes identified in step (b) thereby to eliminate or CC reduce the immunogenicity of the protein when exposed to the immune CC system of the given species. A method of analysing a pre-existing protein CC to predict the basis for immunogenic responses is also provided. The CC immunoglobulins or therapeutic proteins, e.g. Streptokinase (SK). The CC compresents the amino acid sequence of the SK protein. (Updated on 17-OCT-CC 2003 to standardise OS field)
